

Questionnaire Builder App

Overview

Web-based application for building questionnaires.

There are three complexity levels: base, middle and advanced.

The base level is sufficient to pass the test task stage. Still, accomplished tasks with a harder level of complexity will highly increase your chance of getting to the school.

Requirements

- Add the level of accomplished tasks in the README.md file.
- Upload source code to GitHub/BitBucket/GitLab and share a link.
- Host an application in any preferable way and share the URL to access it.
- The front-end part must be done in HTML/CSS/JavaScript (with or without any framework), with any preferred design style.
- The back-end part can be done with or without any framework.
- Use any relational or non-relational database.

Base level

- **Questionnaire catalog page:** page where users can observe the paginated list of available questionnaires. Card should consist of:
 - questionnaire name;
 - description;
 - amount of questions;
 - amount of completions;
 - actions: edit/run/delete ("edit" action should page similar to creation page);

Pagination here

- **Questionnaire builder page:** page where users can create a questionnaire by adding multiple questions.

Possible question types:

- *text* - free-form user input;
- *single choice* - user can select only one of the possible answers (radio buttons);
- *multiple choices* - user can select several answers (checkbox buttons);

Once the questionnaire is submitted, it should be stored in a database.

Add question

- **Interactive questionnaire page:** page where users can complete the questionnaire created earlier. At the end of the questionnaire the user should see all his answers and the time it took to complete the questionnaire. Once the questionnaire is completed, responses should be stored in the database. This page should be available by clicking on the “Run” action.

Middle level

- Everything from the base level
- **Questionnaire catalog page:** add ability to sort questionnaires by: name, amount of questions, amount of completions.
- **Questionnaire builder page:** add “drag and drop” functionality to allow user to re-order questions/answers by dragging them;
- **Interactive questionnaire page:** save intermediate completion state so that when the user refreshes the page he can continue from where he left.

Advanced level

- Everything from the middle level
- **Questionnaire catalog page:** add infinite scroll pagination (when a user scrolls the page, it automatically loads more questionnaires).
- **Questionnaire statistics page:** add page displaying general statistics for the questionnaire. Suggested metrics:
 - average completion time;
 - amount of completions per day/week/month (line/bar chart);
 - piechart for each question (count of selections per question answer);
- **Questionnaire builder page:** add “image” question type so that users are allowed to upload images for this question during questionnaire completion.
